Introduction

In this lab, you will configure the Palo Alto Networks Firewall as a DHCP server. You will then test the DHCP server with the Client PC.

Objective

In this lab, you will perform the following tasks:

- Configure DHCP Server
- Configure Client for DHCP
- Configure a DHCP Client Reservation
- Configure the Firewall Outside Interface for DHCP

Lab Topology

Lab Settings

The information in the table below will be needed in order to complete the lab. The task sections below provide details on the use of this information.

Virtual Machine	IP Address	Account (if needed)	Password (if needed)
Client	192.168.1.20	lab-user	Pal0Alt0!
DMZ	192.168.50.10	root	Pal0Alt0!
Firewall	192.168.1.254	admin	Pal0Alt0!

1 Configuring DHCP

1.0 Load Lab Configuration

In this section, you will load the Firewall configuration file.

1. Click on the **Client** tab to access the Client PC.

2. Log in to the Client PC as username `lab-user`, password `Pa10Alt0!`.
3. Double-click the **Chromium Web Browser** icon located on the Desktop.

4. In the *Chromium* address field, type `https://192.168.1.254` and press **Enter**.

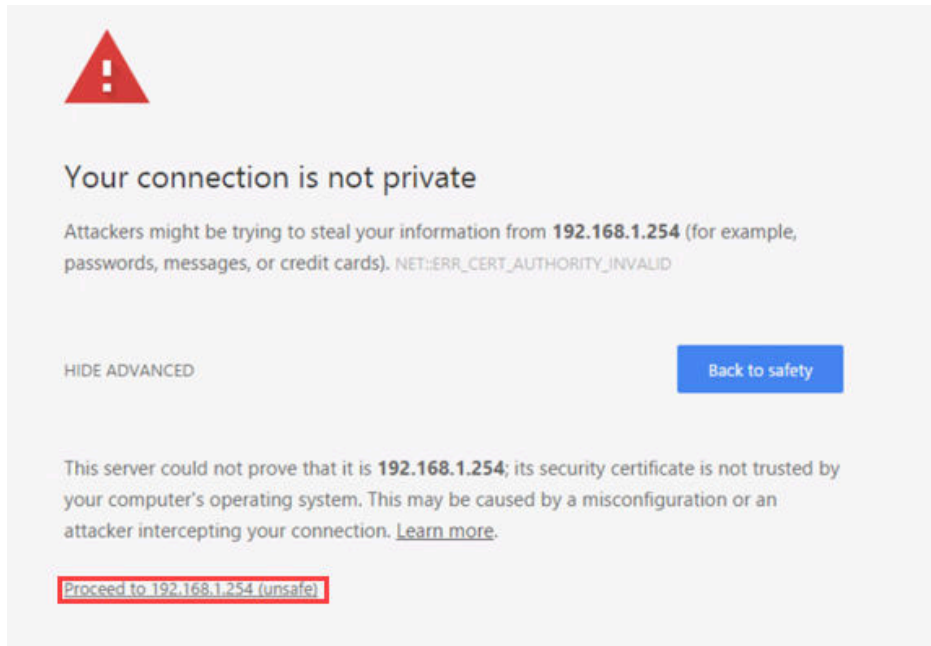

5. You will see a “Your connection is not private” message. Click on the **ADVANCED** link.

If you experience the “Unable to connect” or “502 Bad Gateway” message while attempting to connect to the specified IP above, please wait an additional 1-3 minutes for the Firewall to fully initialize. Refresh the page to continue.

- Click on **Proceed to 192.168.1.254 (unsafe)**.

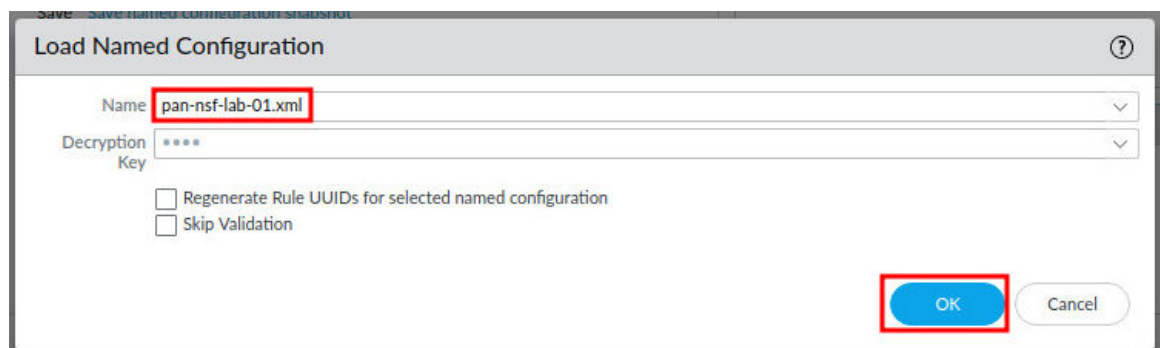

- Log in to the Firewall web interface as username admin, password Pal0Alt0!.

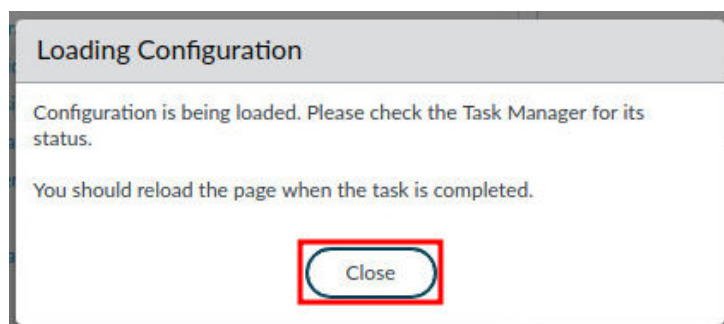

8. In the web interface, navigate to **Device > Setup > Operations** and click on **Load** named configuration snapshot underneath the *Configuration Management* section.

9. In the *Load Named Configuration* window, select **pan-nsf-lab-01.xml** from the *Name* dropdown box and click **OK**.

10. In the *Loading Configuration* window, a message will show *Configuration is being loaded*. Please check the Task Manager for its status. You should reload the page when the task is completed. Click **Close** to continue.

11. Click the **Tasks** icon located at the bottom-right of the web interface.

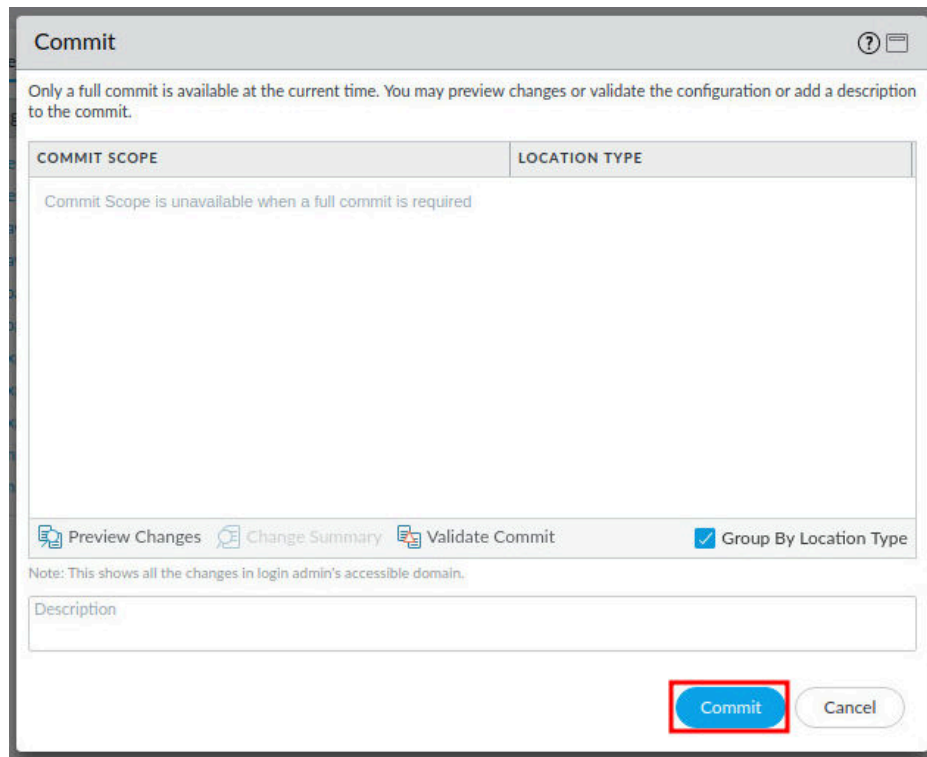

12. In the *Task Manager – All Tasks* window, verify the *Load* type has successfully completed. Click **Close**.

13. Click the **Commit** link located at the top-right of the web interface.

14. In the *Commit* window, click **Commit** to proceed with committing the changes.

15. When the commit operation successfully completes, click **Close** to continue.

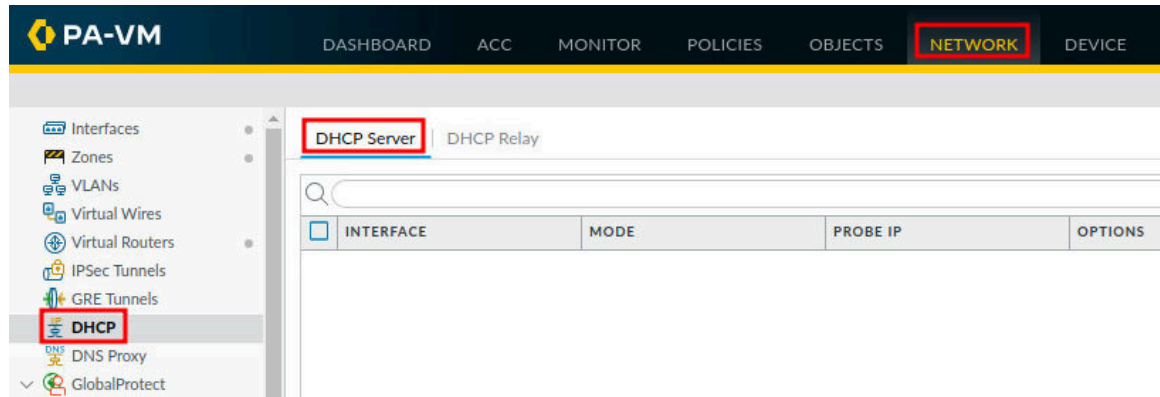

The commit process takes changes made to the Firewall and copies them to the running configuration, which will activate all configuration changes since the last commit.

1.1 Configure DHCP Server

In this section, you will configure a DHCP Server on the Firewall. By adding a DHCP server to the Firewall, clients behind the Firewall will not have to configure IP addresses manually. A client that is configured for DHCP and connected to the same network as the Firewall will receive an IP address automatically, reducing network configuration errors.

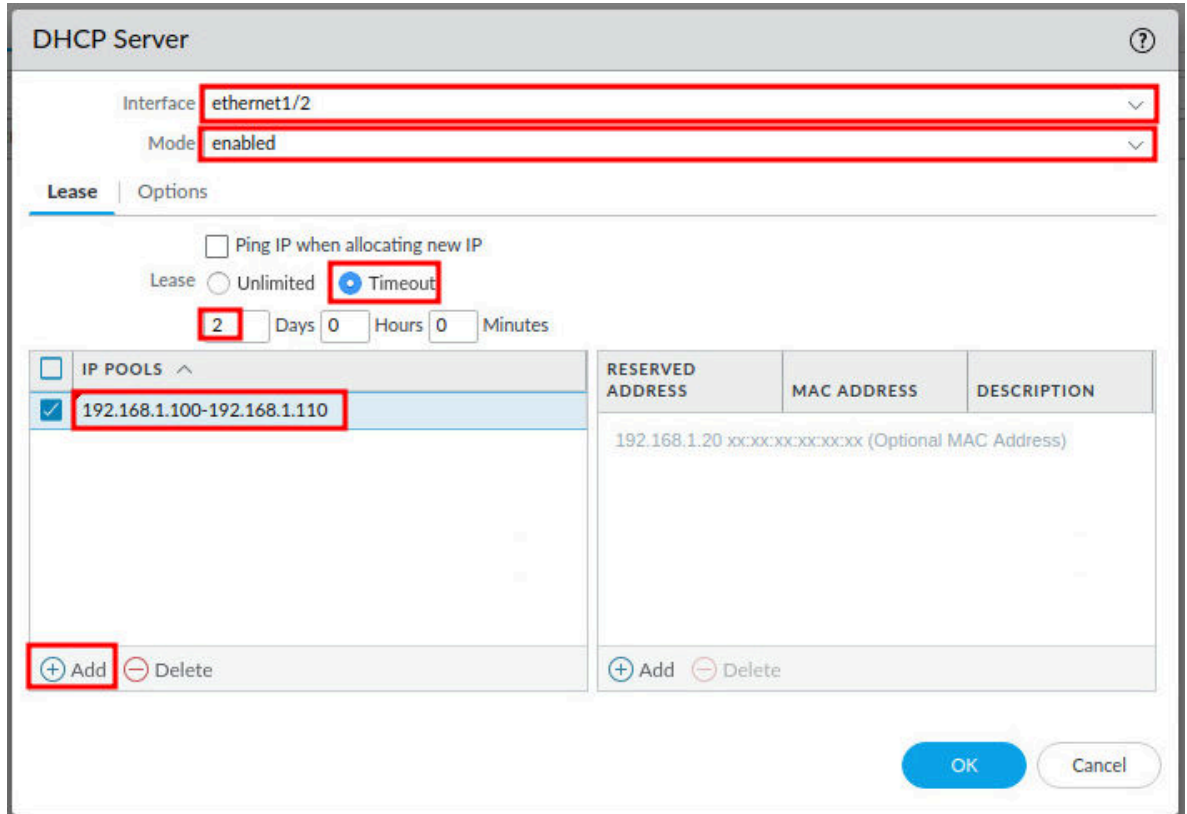

1. Navigate to **Network > DHCP > DHCP Server**.

2. Click on **Add**, located near the bottom-left of the *DHCP Server* box.

3. In the *DHCP Server* window, select **ethernet1/2** for the *Interface* dropdown. Next, in the *Mode* dropdown, select **enabled**. Then, in the *Lease* radio button, select **Timeout** and give it a value of **2** days. Finally, in the *IP Pools*, click the **Add** button at the bottom-left of the *IP Pools* section and enter 192.168.1.100–192.168.1.110.

DHCP Server

Interface: ethernet1/2

Mode: enabled

Lease Options

☐ Ping IP when allocating new IP

Lease: ☐ Unlimited ☒ Timeout

2 Days 0 Hours 0 Minutes

IP POOLS

RESERVED ADDRESS	MAC ADDRESS	DESCRIPTION
192.168.1.20	xxxxxxxxxxxx (Optional MAC Address)	

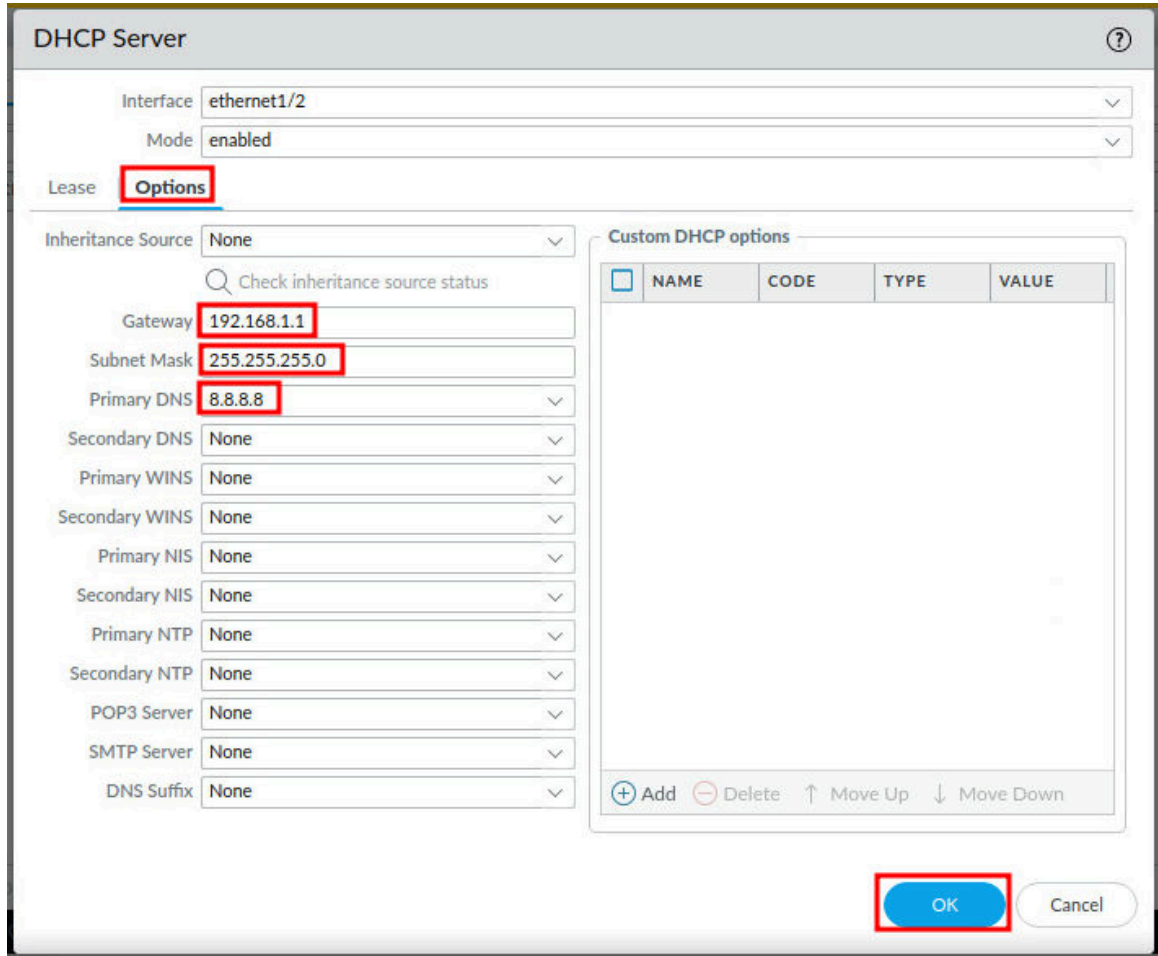

+ Add - Delete

OK Cancel

ethernet1/2 is selected to run DHCP because this is the network that the Client is connected to. In this configuration, the Client will receive an IP address automatically. By specifying a 2-day timeout, the client will need to request a new IP address every 2 days. The IP Pool created will limit the number of IP addresses that the firewall will automatically distribute.

- Click on the **Options** tab and type 192.168.1.1 in the *Gateway* field, 255.255.255.0 in the *Subnet Mask* field, and type 8.8.8.8 in the *Primary DNS* field.

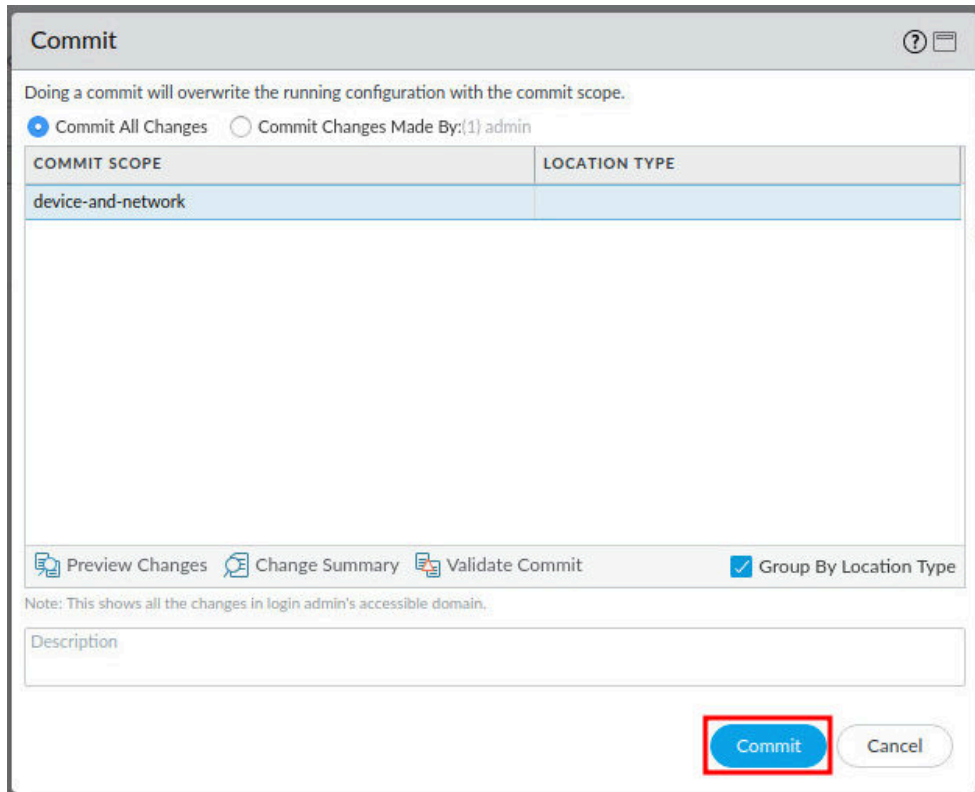

The Gateway of 192.168.1.1 is the interface for the Firewall. DHCP will send this to the Client so that the Client will have a default gateway. The Primary DNS server, 8.8.8.8, is one of Google's public DNS servers. DHCP will also send this information to the Client so that the Client will have a DNS server.

- Click the **OK** button on the *DHCP Server* window.
- Click the **Commit** link located at the top-right of the web interface.

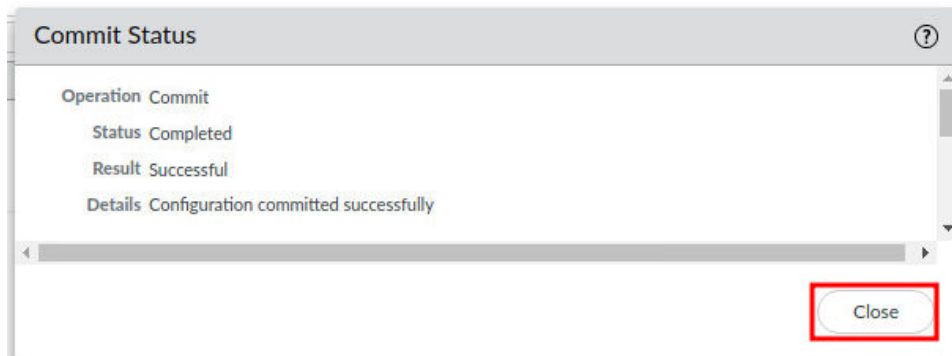

7. In the *Commit* window, click **Commit** to proceed with committing the changes.

The **Commit** window displays a message: "Doing a commit will overwrite the running configuration with the commit scope." Below this, there are two radio buttons: **Commit All Changes** (selected) and **Commit Changes Made By: {1} admin**. A table with two columns, **COMMIT SCOPE** and **LOCATION TYPE**, shows a single row with the value **device-and-network** under **COMMIT SCOPE**. At the bottom, there are three icons: **Preview Changes**, **Change Summary**, and **Validate Commit**, followed by a checked checkbox for **Group By Location Type**. A note states: "Note: This shows all the changes in login admin's accessible domain." Below the note is a text area labeled **Description**. At the bottom right, there are two buttons: **Commit** (highlighted with a red box) and **Cancel**.

8. When the commit operation successfully completes, click **Close** to continue.

The **Commit Status** window displays the following information:

- Operation: Commit
- Status: Completed
- Result: Successful
- Details: Configuration committed successfully

At the bottom right, there is a **Close** button (highlighted with a red box).

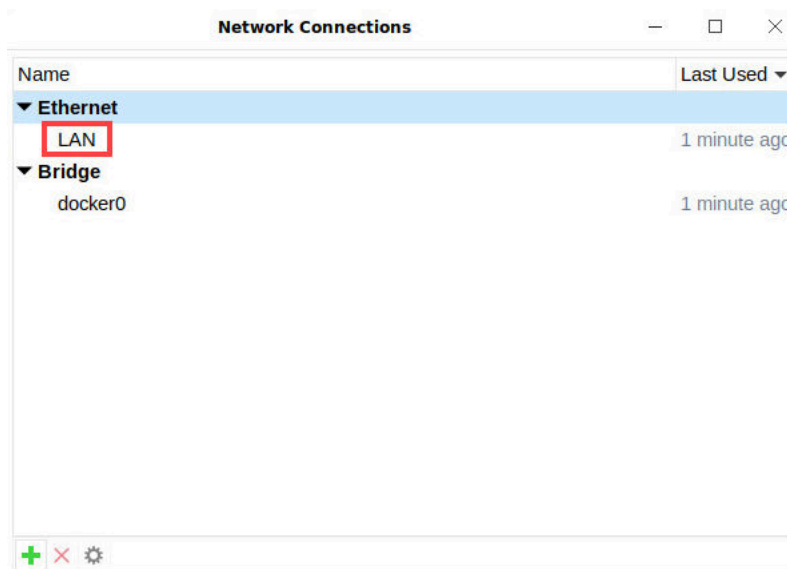

1.2 Configure Client for DHCP

In this section, you will confirm the current configuration of the Client. Then, you will configure the client for DHCP and confirm a Dynamic IP address was assigned.

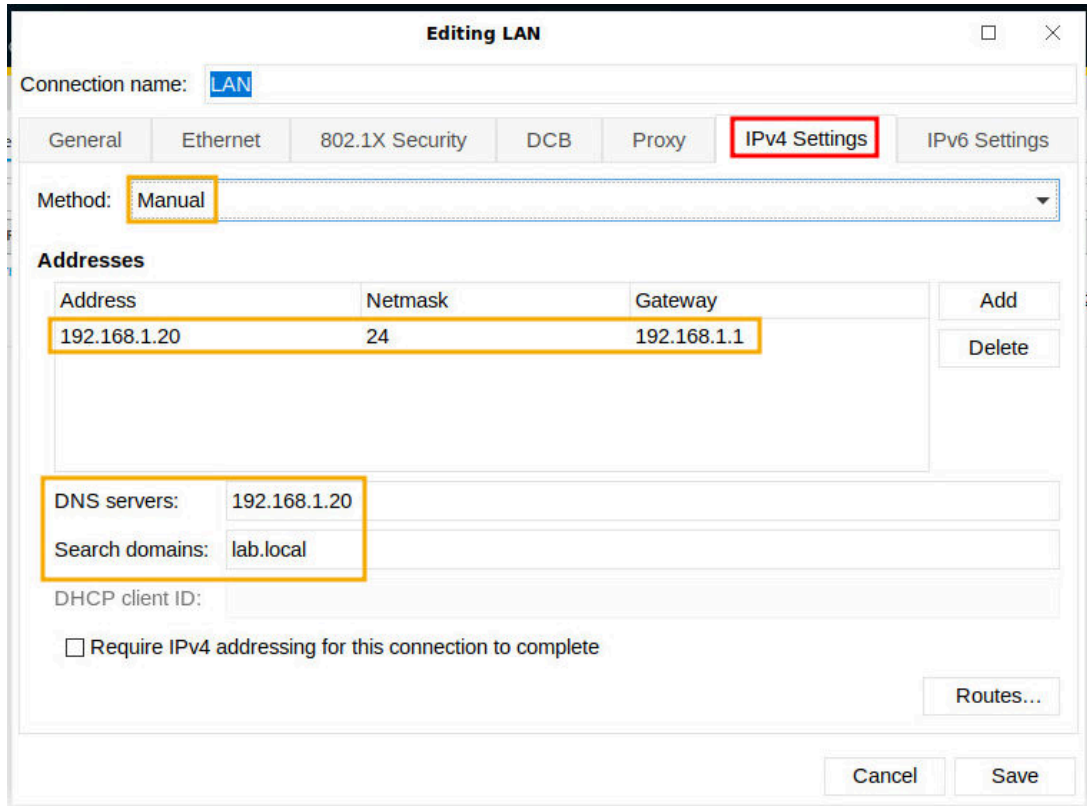

1. Click on the **Connection** icon in the lower-right of the web *Client*. Next, click on **Edit Connections**.

2. In the *Network Connections* window, under the *Ethernet* dropdown list, double-click **LAN**.

3. In the *Editing LAN* window, click **IPv4 Settings**. Leave the *Editing LAN* window open for the next step.

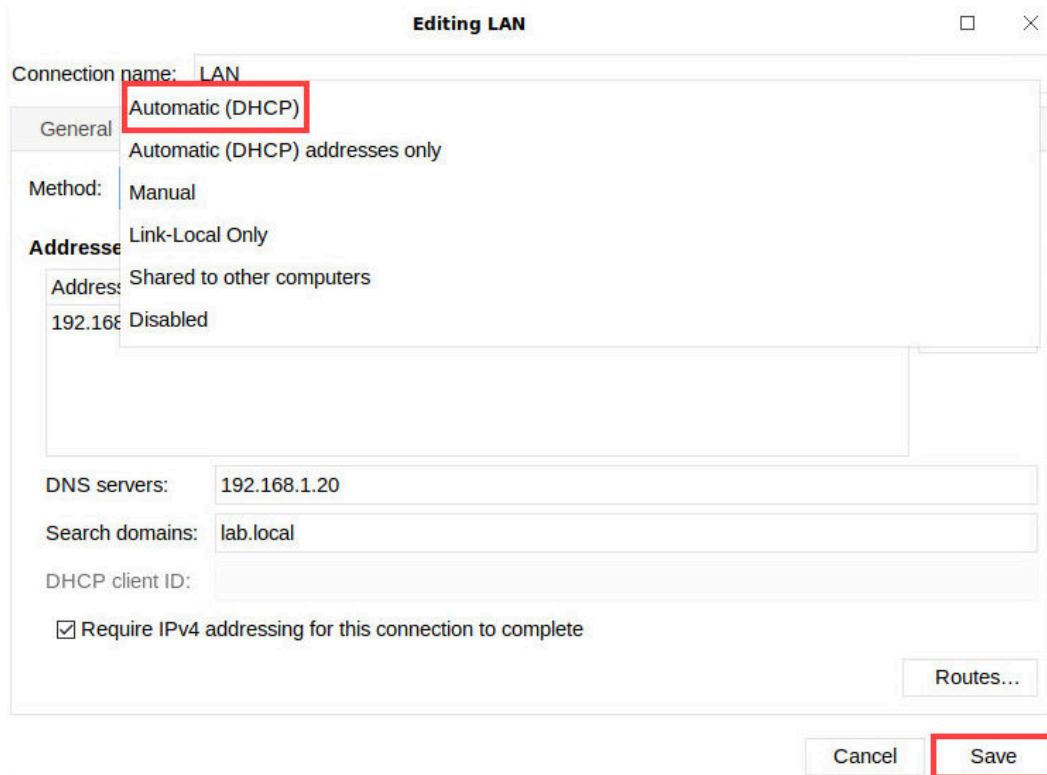

The screenshot shows the 'Editing LAN' window with the 'IPv4 Settings' tab selected. The 'Connection name' is 'LAN'. The 'Method' is set to 'Manual'. The 'Addresses' table contains one entry: Address 192.168.1.20, Netmask 24, and Gateway 192.168.1.1. The 'DNS servers' field is set to 192.168.1.20 and the 'Search domains' field is set to lab.local. The 'DHCP client ID' field is empty. The 'Require IPv4 addressing for this connection to complete' checkbox is unchecked. The 'Routes...' button is visible. The 'Cancel' and 'Save' buttons are at the bottom right.

Address	Netmask	Gateway
192.168.1.20	24	192.168.1.1

Notice that the method is set to **Manual**. By default, in this lab environment, the Client is configured with a static IP address of **192.168.1.20**, a Netmask of **24** which is **255.255.255.0**, a default gateway of **192.168.1.1**. The DNS server is set to **192.168.1.20** and the search domain is **lab.local**.

- In the *Editing LAN* window, click on the **Method** and select **Automatic (DHCP)**. Click **Save** and close the *Editing LAN* window.

Editing LAN

Connection name: LAN

General

Method: Automatic (DHCP)

Automatic (DHCP) addresses only

Method: Manual

Link-Local Only

Address: Shared to other computers

192.168.1.20 Disabled

DNS servers: 192.168.1.20

Search domains: lab.local

DHCP client ID:

☒ Require IPv4 addressing for this connection to complete

Routes...

Cancel Save

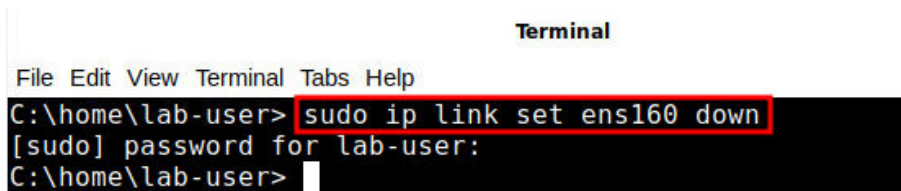

In the Client, the settings **Use the following IP address** and **Use the following DNS server addresses** are used when configuring static IP addresses. By changing them to obtain Automatic (DHCP), you are enabling DHCP.

- Click on the **Xfce Terminal** icon in the taskbar.

- In the *Terminal* window, type `sudo ip link set ens160 down`. Enter the `Pa10Alt0!` password when prompted, and press **Enter**. Leave the *Terminal* window open for the next step.

Terminal

File Edit View Terminal Tabs Help

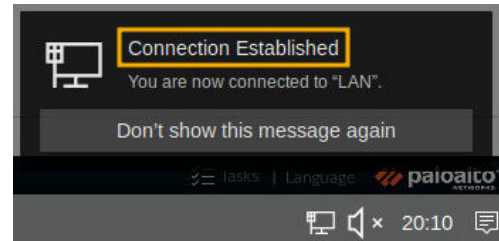

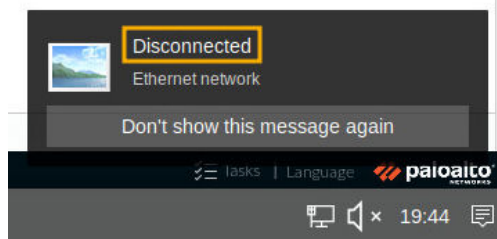

```
C:\home\lab-user> sudo ip link set ens160 down
[sudo] password for lab-user:
C:\home\lab-user>
```

7. With the *Terminal* window still open, type `sudo ip link set ens160 up` and press **Enter**. Leave the *Terminal* window open for the next step.

```
C:\home\lab-user> sudo ip link set ens160 down
[sudo] password for lab-user:
C:\home\lab-user> sudo ip link set ens160 up
C:\home\lab-user>
```

In the previous two steps, you may need to pause for several seconds to confirm that the link has shut down and come back up. Look for the popups indicating this.

8. In the *Terminal* window, type `ip addr` and press **Enter**. Notice the **link/ether** address, also known as the MAC address, of the `ip` command output. (The MAC address will be used in the next task). Leave the *Terminal* window open for the next task.

```
C:\home\lab-user> ip addr
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1000
   link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
   inet 127.0.0.1/8 scope host lo
       valid_lft forever preferred_lft forever
   inet6 ::1/128 scope host
       valid_lft forever preferred_lft forever
2: ens160: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc fq_codel state UP group default qlen 1000
   link/ether 00:50:56:8a:0d:49 brd ff:ff:ff:ff:ff:ff
   inet 192.168.1.100/24 brd 192.168.1.255 scope global dynamic noprefixroute ens160
       valid_lft 172641sec preferred_lft 172641sec
   inet 192.168.1.20/24 brd 192.168.1.255 scope global secondary noprefixroute ens160
       valid_lft forever preferred_lft forever
   inet6 fe80::c317:4ce7:59df:690a/64 scope link noprefixroute
       valid_lft forever preferred_lft forever
3: docker0: <NO-CARRIER,BROADCAST,MULTICAST,UP> mtu 1500 qdisc noqueue state DOWN group default
   link/ether 02:42:16:ab:b1:3e brd ff:ff:ff:ff:ff:ff
   inet 172.17.0.1/16 brd 172.17.255.255 scope global docker0
       valid_lft forever preferred_lft forever
C:\home\lab-user>
```

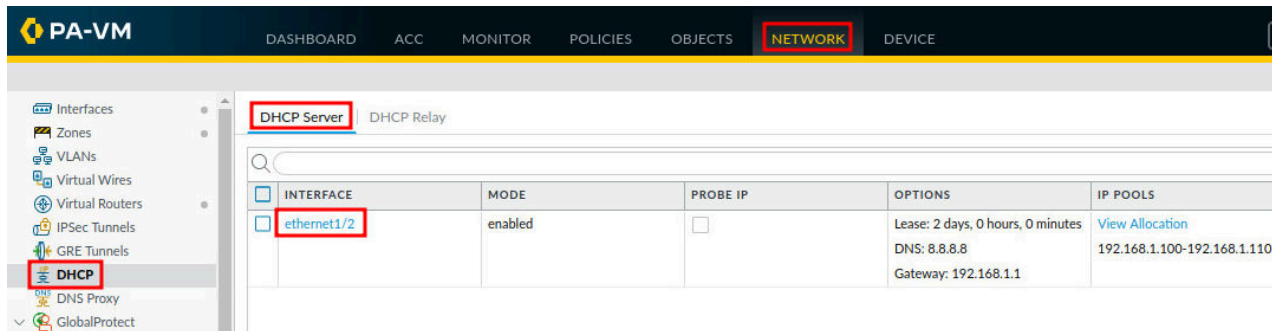

Notice, the IP address (labeled **inet**) has changed to **192.168.1.100**, is labeled **dynamic**, and is in the DHCP range that was configured in a previous task, and **valid_lft** indicates a lifetime of **172641 seconds**, which is the 2-day timeout referred to in that previous task. Additionally, the **Manual** address of **192.168.1.20** is still there, but listed as secondary, and has a lifetime of forever.

9. Type **exit** and press **Enter** to close the *Terminal* window.

1.3 Configure a DHCP Client Reservation

In this section, you will configure a DHCP Client Reservation. A client reservation is a way to statically assign an IP address to a client via the DHCP Server. The client remains configured for DHCP; however, the DHCP Server will lease the IP address assigned to that physical address or MAC address every time the Client requests a new IP address. As each computer has a unique MAC address, this will assist the DHCP server in leasing the proper address.

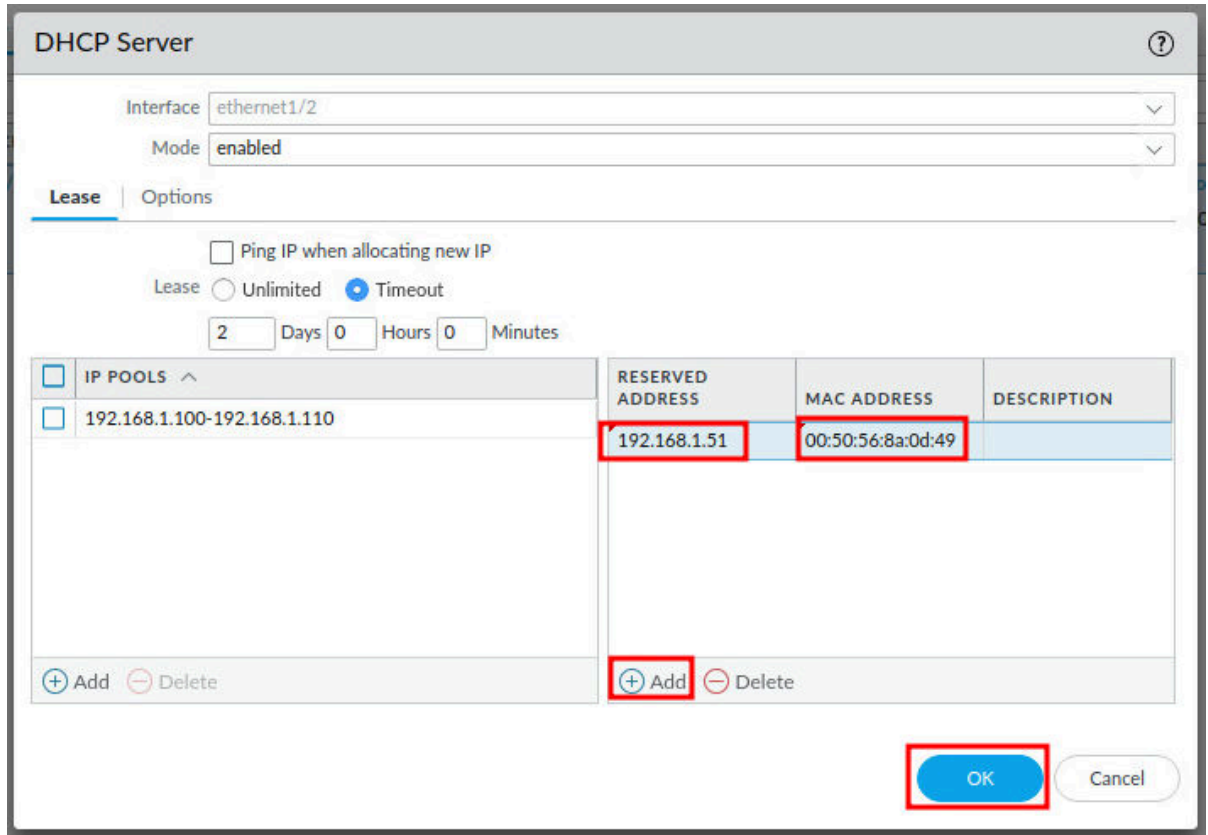

1. On the Firewall administration page, navigate to **Network > DHCP > DHCP Server**, and click on **ethernet1/2**.

The screenshot shows the PA-VM Firewall administration interface. The left sidebar contains a navigation menu with items: Interfaces, Zones, VLANs, Virtual Wires, Virtual Routers, IPsec Tunnels, GRE Tunnels, **DHCP** (highlighted), DNS Proxy, and GlobalProtect. The main content area has a top navigation bar with tabs: DASHBOARD, ACC, MONITOR, POLICIES, OBJECTS, **NETWORK** (highlighted), and DEVICE. Under the NETWORK tab, there are two sub-tabs: **DHCP Server** (highlighted) and DHCP Relay. Below the sub-tabs is a search bar and a table with the following data:

INTERFACE	MODE	PROBE IP	OPTIONS	IP POOLS
<input type="checkbox"/> ethernet1/2	enabled	<input type="checkbox"/>	Lease: 2 days, 0 hours, 0 minutes DNS: 8.8.8.8 Gateway: 192.168.1.1	View Allocation 192.168.1.100-192.168.1.110

- Click on the **Add** button under the *Reserved Address* section on the right. Then, type 192.168.1.51 for the *Reserved Address*. Finally, type the *MAC Address* of the Client, 00:50:56:8a:0d:49. Click the **OK** button to close the *DHCP Server* window.

IP POOLS	RESERVED ADDRESS	MAC ADDRESS	DESCRIPTION
192.168.1.100-192.168.1.110	192.168.1.51	00:50:56:8a:0d:49	

Notice, the MAC address may be displayed slightly. Different systems represent the MAC address in different ways. The Firewall requires colon notation, others may use dash notation. Some systems even condense part of the address, i.e., **0050.568a.0d49**.

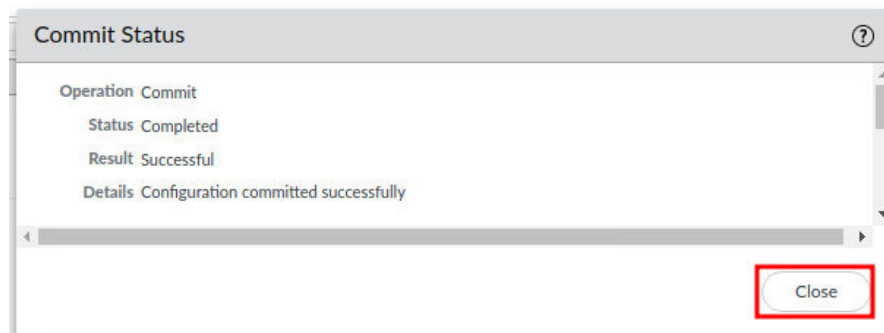

- Click the **Commit** link located at the top-right of the web interface.

4. In the *Commit* window, click **Commit** to proceed with committing the changes.

5. When the commit operation successfully completes, click **Close** to continue.

6. Click on the **Xfce Terminal** icon in the taskbar.

- In the *Terminal* window, type `sudo ip link set ens160 down`. Enter the `Pa10Alt0!` password when prompted, and press **Enter**. Leave the *Terminal* window open for the next step.

```

Terminal
File Edit View Terminal Tabs Help
C:\home\lab-user> sudo ip link set ens160 down
[sudo] password for lab-user:
C:\home\lab-user>

```

- With the *Terminal* window still open, type `sudo ip link set ens160 up` and press **Enter**. Leave the *Terminal* window open for the next step.

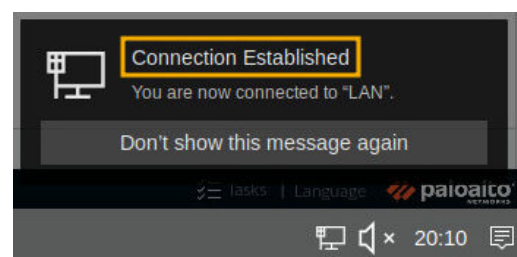

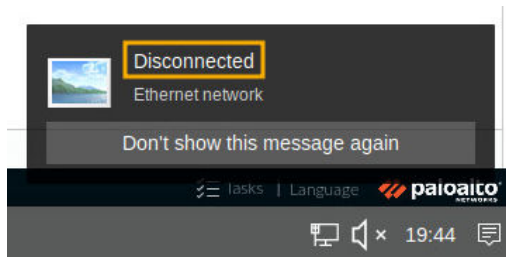

```

C:\home\lab-user> sudo ip link set ens160 down
[sudo] password for lab-user:
C:\home\lab-user> sudo ip link set ens160 up
C:\home\lab-user>

```

In the previous two steps, you may need to pause for several seconds to confirm that the link has shut down and come back up. Look for the popups indicating this.

- In the *Terminal* window, type `ip addr` and press **Enter**. This command will show the new lease from the DHCP server.

```

C:\home\lab-user> ip addr
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1000
   link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
   inet 127.0.0.1/8 scope host lo
       valid_lft forever preferred_lft forever
   inet6 ::1/128 scope host
       valid_lft forever preferred_lft forever
2: ens160: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc fq_codel state UP group default qlen 1000
   link/ether 00:50:56:8a:0d:49 brd ff:ff:ff:ff:ff:ff
   inet 192.168.1.51/24 brd 192.168.1.255 scope global dynamic noprefixroute ens160
       valid_lft 172526sec preferred_lft 172526sec
   inet 192.168.1.20/24 brd 192.168.1.255 scope global secondary noprefixroute ens160
       valid_lft forever preferred_lft forever
   inet6 fe80::c317:4ce7:59df:690a/64 scope link noprefixroute
       valid_lft forever preferred_lft forever
3: docker0: <NO-CARRIER,BROADCAST,MULTICAST,UP> mtu 1500 qdisc noqueue state DOWN group default
   link/ether 02:42:16:ab:b1:3e brd ff:ff:ff:ff:ff:ff
   inet 172.17.0.1/16 brd 172.17.255.255 scope global docker0
       valid_lft forever preferred_lft forever
C:\home\lab-user>

```

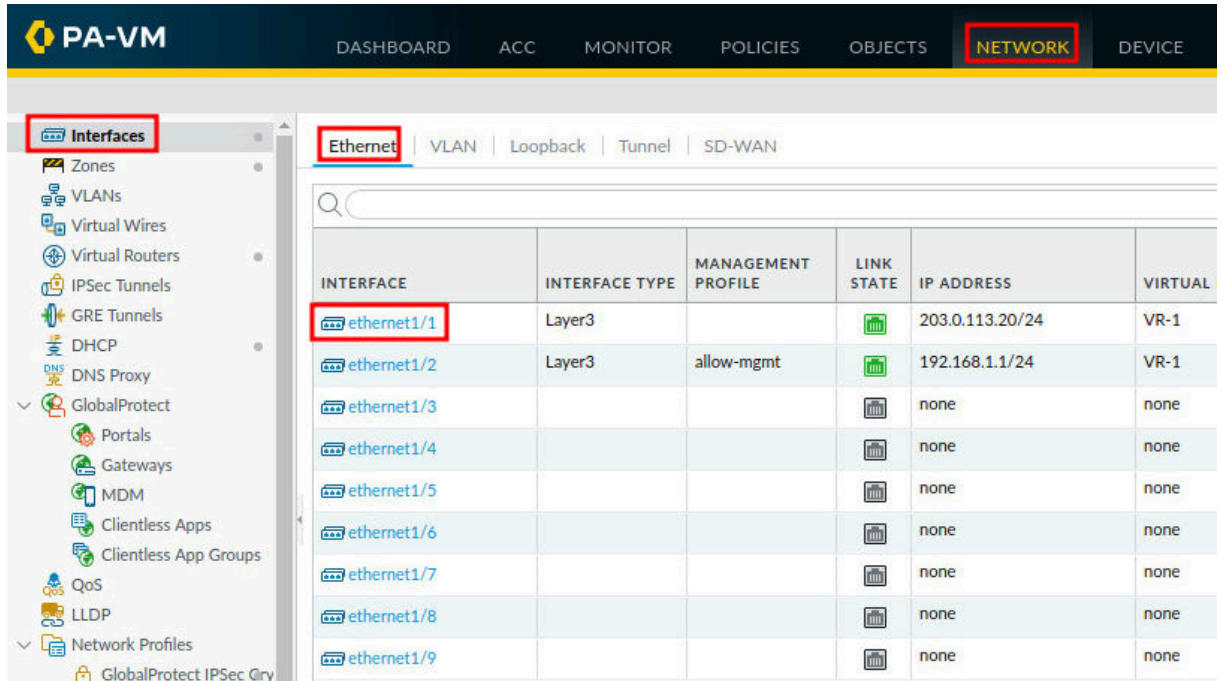

You should receive an IP address of **192.168.1.51**. This was the address you reserved for the Client machine on the firewall. If you receive a different address, repeat this section and take careful note of the MAC address.

10. Type **exit** and press **Enter** to exit the *Terminal* window.

1.4 Configure the Firewall Outside Interface for DHCP

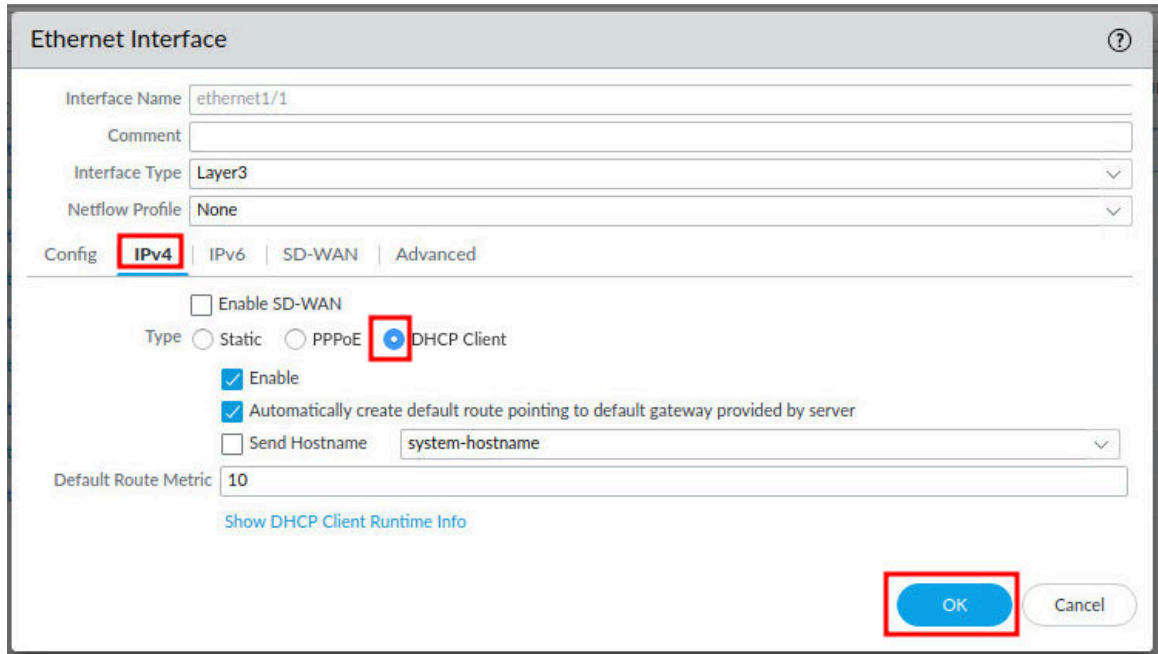

In this section, you will configure the Firewall outside interface for DHCP. Like the Client in the previous task, the Firewall will obtain an IP address from a DHCP server on the network.

1. On the Firewall administration page, navigate to **Network > Interfaces > Ethernet**. Click on **ethernet1/1**.

INTERFACE	INTERFACE TYPE	MANAGEMENT PROFILE	LINK STATE	IP ADDRESS	VIRTUAL
ethernet1/1	Layer3			203.0.113.20/24	VR-1
ethernet1/2	Layer3	allow-mgmt		192.168.1.1/24	VR-1
ethernet1/3				none	none
ethernet1/4				none	none
ethernet1/5				none	none
ethernet1/6				none	none
ethernet1/7				none	none
ethernet1/8				none	none
ethernet1/9				none	none

2. On the *Ethernet Interface* window, click on the **IPv4** tab. Then, select the **DHCP Client** radio button in the *Type* field. Finally, click the **OK** button.

The screenshot shows the 'Ethernet Interface' configuration window. The 'Interface Name' is 'ethernet1/1'. The 'Interface Type' is 'Layer3'. The 'Netflow Profile' is 'None'. The 'Config' tab is selected, and the 'IPv4' sub-tab is active. Under the 'Type' field, the 'DHCP Client' radio button is selected. The 'Enable' checkbox is checked, and the 'Automatically create default route pointing to default gateway provided by server' checkbox is also checked. The 'Send Hostname' checkbox is unchecked, and the 'Default Route Metric' is set to '10'. The 'OK' button is highlighted with a red box.

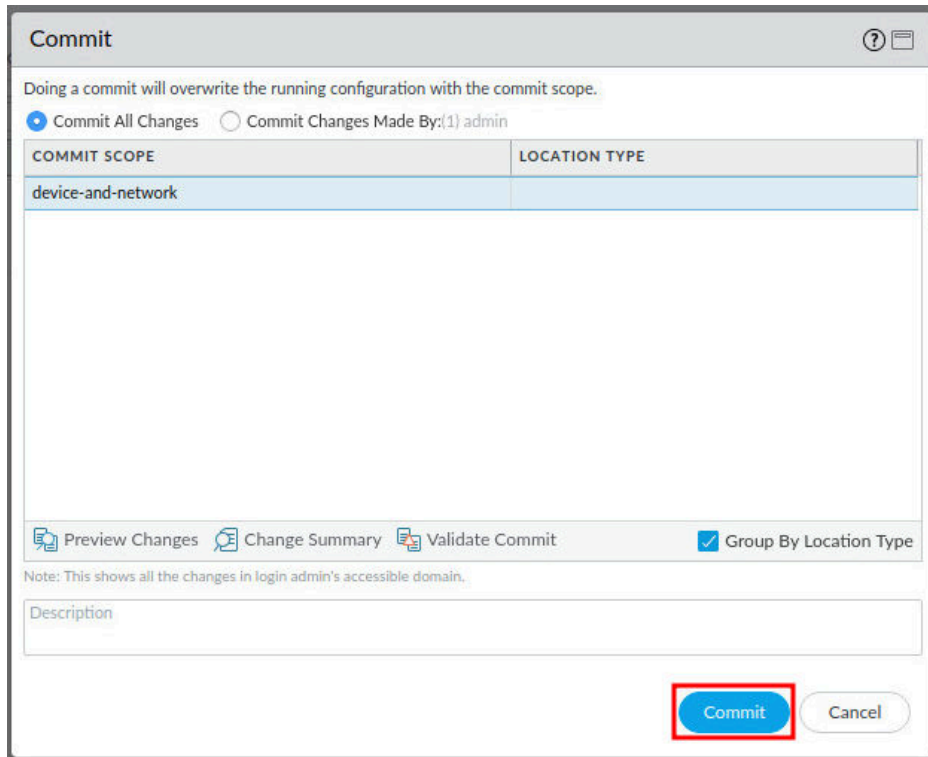

The **DHCP Client** setting allows the Firewall interface to receive a dynamic IP Address. Some internet service providers will provide an IP address via DHCP, in which case the Firewall will need to be configured to receive a dynamic IP Address.

3. Click the **Commit** link located at the top-right of the web interface.

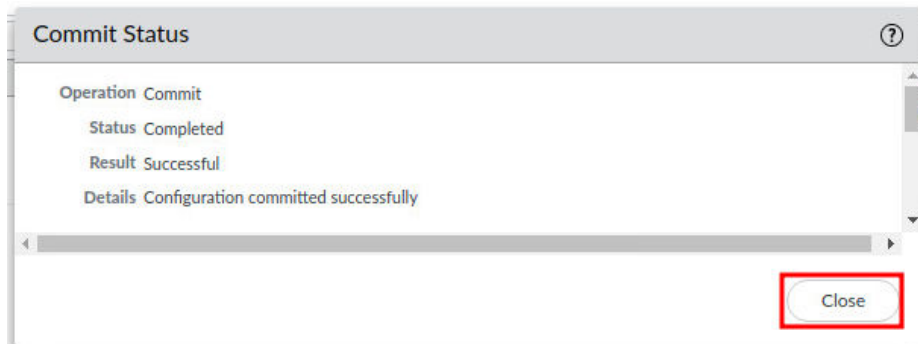

4. In the *Commit* window, click **Commit** to proceed with committing the changes.

The screenshot shows the 'Commit' window. At the top, it says 'Doing a commit will overwrite the running configuration with the commit scope.' Below this, there are two radio buttons: 'Commit All Changes' (selected) and 'Commit Changes Made By: (1) admin'. A table with two columns, 'COMMIT SCOPE' and 'LOCATION TYPE', is shown. The first row has 'device-and-network' under 'COMMIT SCOPE' and is empty under 'LOCATION TYPE'. Below the table, there are three icons with labels: 'Preview Changes', 'Change Summary', and 'Validate Commit'. To the right of these is a checked checkbox labeled 'Group By Location Type'. Below this is a note: 'Note: This shows all the changes in login admin's accessible domain.' At the bottom right, there are two buttons: 'Commit' (highlighted with a red box) and 'Cancel'.

COMMIT SCOPE	LOCATION TYPE
device-and-network	

5. When the commit operation successfully completes, click **Close** to continue.

The screenshot shows the 'Commit Status' window. It displays the following information: 'Operation Commit', 'Status Completed', 'Result Successful', and 'Details Configuration committed successfully'. At the bottom right, there is a 'Close' button highlighted with a red box.

- Click on the **Dynamic-DHCP Client** link under the *IP Address* field for **ethernet1/1**.

Ethernet VLAN Loopback Tunnel SD-WAN						
Q						
INTERFACE	INTERFACE TYPE	MANAGEMENT PROFILE	LINK STATE	IP ADDRESS	VIRTUAL ROUTER	
 ethernet1/1	Layer3			Dynamic-DHCP Client	VR-1	U
 ethernet1/2	Layer3	allow-mgmt		192.168.1.1/24	VR-1	U
 ethernet1/3				none	none	U
 ethernet1/4				none	none	U
 ethernet1/5				none	none	U
 ethernet1/6				none	none	U
 ethernet1/7				none	none	U
 ethernet1/8				none	none	U
 ethernet1/9				none	none	U

- You should receive an *IP Address* of **203.0.113.x**, where x could be any number starting with the number 2 thru 254. This was obtained from the DHCP Server running on the VRouter between the Firewall and the External Network. (Note also the lease time of less than an hour.)

Dynamic IP Interface Status

Interface ethernet1/1

State Bound

Remaining Lease Time 0 days 0:58:52

IP Address 203.0.113.21

Gateway 203.0.113.1
